

Linked Views Design Choices

My visualisation demonstrates all districts of Amsterdam in different colours, so that you can clearly distinguish them. The bar chart visualizes the amount of restaurants in a neighbourhood. This way you can clearly see which district has the most options. When opened, both the bar chart and the map will appear. However when you click on the map, the bar chart will hide and with another click it will show again.

My original idea was to visualize the exact locations of all the restaurant and to distinguish between restaurants and cafés. Unfortunately, this was a little too ambitious for this assignment. Perhaps I will further explore the possibilities in the next course. On the website of “Gemeente van Amsterdam”, a lot of data is provided which makes Amsterdam very interesting subject for data visualisation.
